

Ethan Gehring
Lab 2

This lab showed me how difficult estimating the time it takes to program something. It is especially hard when you are estimating time working on a project you know little about and do not know what has been done previously. In my scrum the numbers represented approximately half a day of work making an 8 an achievable goal for a week. Whenever disagreements were had each party would offer their explanation and as a group we would discuss until we could come to some agreement. Most disagreements were over what the story actually meant rather than the time it would take to accomplish that thing.
